Report Guideline and Grade Criteria (5.5 hp, A-F), DV2657

Overview:

Select a potential idea for the report that focuses on research methods, data collection, and analysis. This can be done individually or in pairs (for exceptions, contact the course coordinator).

Requirements:

1. Summarize current research articles in a well-structured report.
2. Describe research methods, data collection techniques, and analysis approaches.
3. Conduct a small research project by collecting and analyzing data, then compare the results with relevant research articles.
4. Provide a comprehensive, research-based account of state-of-the-art technologies in a field relevant to the education program. This should include:
    - Summary
    - Keywords/classification
    - Introduction/broader context
    - Relevance/gap
    - Research question/problem formulation
    - Scientific research methodology
    - Technical solution
    - Results
    - Evaluation/discussion
    - Conclusions
    - Future research directions
    - Relevant full references
5. Discuss and assess studies with regard to ethical and societal implications.
6. Reflect on the possibilities and limitations of science, its societal role, and the responsibilities associated with its use.
7. The report should be 8-10 pages long, submitted in PDF format to Canvas, and formatted according to the provided template (individual or group submission allowed).

Grading Criteria:

Grade E: The report addresses a scientific question. The technical solution proposal results in initial data collection and analysis. The report meets requirements regarding content, spelling, formatting, grammar, logical structure, and scientific concepts, with minor issues.

Grade D: The report is well-written, though occasional issues may be found regarding content, spelling, formatting, grammar, logical structure, and scientific concepts, as well as data collection and analysis.

Grade C: The report references several relevant current technologies found in recommended links on Canvas and discusses pertinent research aspects such as ethics, validity threats, and societal implications.

Grade B: The report is very well-written, with few issues in content, spelling, formatting, grammar, logical structure, and scientific concepts, as well as data collection and analysis. The content is based on at least five research articles in the field and integrates concepts meaningfully, referencing several examples in current technologies.

Grade A: The report integrates key facts into a broader and deeper analysis, drawing comparisons and connections while including personal reflections and values based on state-of-the-art techniques. The formulation of the question/problem and the data collection and analysis provide relevant and potentially novel insights that could contribute to further research in the field.
